K SCAN AI

Visual commerce for fashion

See it. Say it. Get it.

Eliminating the keyboard from commerce.

CONFIDENTIAL

The beach moment

**“I saw the perfect look.
I had the budget.
But after two hours of search
fatigue,
the intent was gone.”**

**The problem wasn't desire.
The problem was the path to buy.**

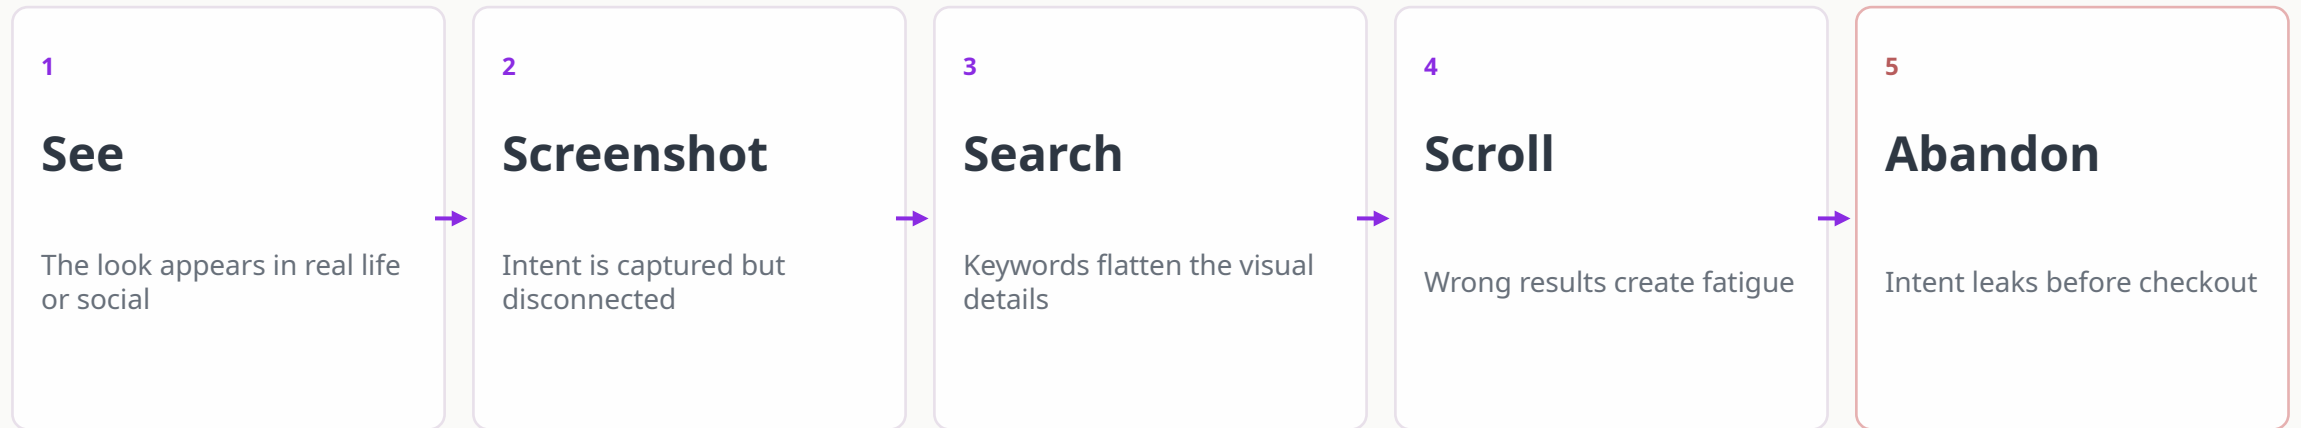

Photo placeholder: replace with Kathleen's preferred lifestyle / beach image.

Search fatigue → The Intent Leak

Fashion discovery is visual. Commerce is still keyword-driven.

High-intent demand disappears before it reaches a retailer.

Search fatigue turns purchase intent into lost revenue.

The interface is shifting

Three changes are converging at the exact moment fashion commerce is ready for a new input layer.

Camera-first behavior

Consumers already discover visually through social, screenshots, and camera search.

AI parses style context

Silhouette, fabric, cut, and fit are becoming machine-readable.

Wearables are emerging

Meta Ray-Ban and the next wave of smart glasses move interaction from typing to seeing.

The keyboard is becoming the bottleneck in commerce.

Start where intent is highest

Initial wedge: 18–34 trend-led shoppers in streetwear and affordable luxury.

HIGH-SIGNAL USER

18–34 trend-led shoppers

- Mobile-first
- Social discovery native
- “Find this exact look” intent
- Creator influence
- Low tolerance for search friction

DIRECTIONAL MARKET VIEW

Streetwear + affordable luxury

The online market for this wedge is measured in tens of billions globally. Capturing even a small share of intent-driven discovery is enough to prove the next round.

We start where intent is highest — not where the market is largest.

Generalists help you know. K Scan helps you buy.

We occupy the moment the walled gardens are not designed to serve.

PLATFORM	WHAT THEY DO	WHY IT DOES NOT SOLVE THIS
Google Lens	Broad recognition	Generalist, not built for fashion conversion
Pinterest	Inspiration	Discovery-first, weak purchase path
Amazon	Commerce	Walled garden, inventory-biased
K Scan	Fashion intent capture	Neutral, attribute-driven, conversion-focused

The Switzerland of fashion discovery

Point. Scan. Buy.

A short bridge from inspiration to purchase.

01

Capture

Scan any outfit in the real world or on social

02

Decode

Style-Parse AI extracts fashion attributes

03

Match

Results route across available retailers

04

Click

User clicks through to purchase

Live testing in Maestro · Beta in 2 weeks

Product interaction mockup · Fashion-specific, retailer-neutral scan-to-click flow

Affiliate-first. Low operational risk.

The first business question is simple: do scans create clicks?

Major fashion affiliate networks initial integration path

Target commission range 5–15% on referred purchases

No operational burden no inventory, warehousing, checkout ownership, or payment processing risk

WHAT WE ARE PROVING

Scans → Clicks → Purchase Intent

- Users scan repeatedly
- Results are useful enough to click or save
- Creator traffic creates early signal

Phase 1 measures behavior, not scale.

Style-Parse AI

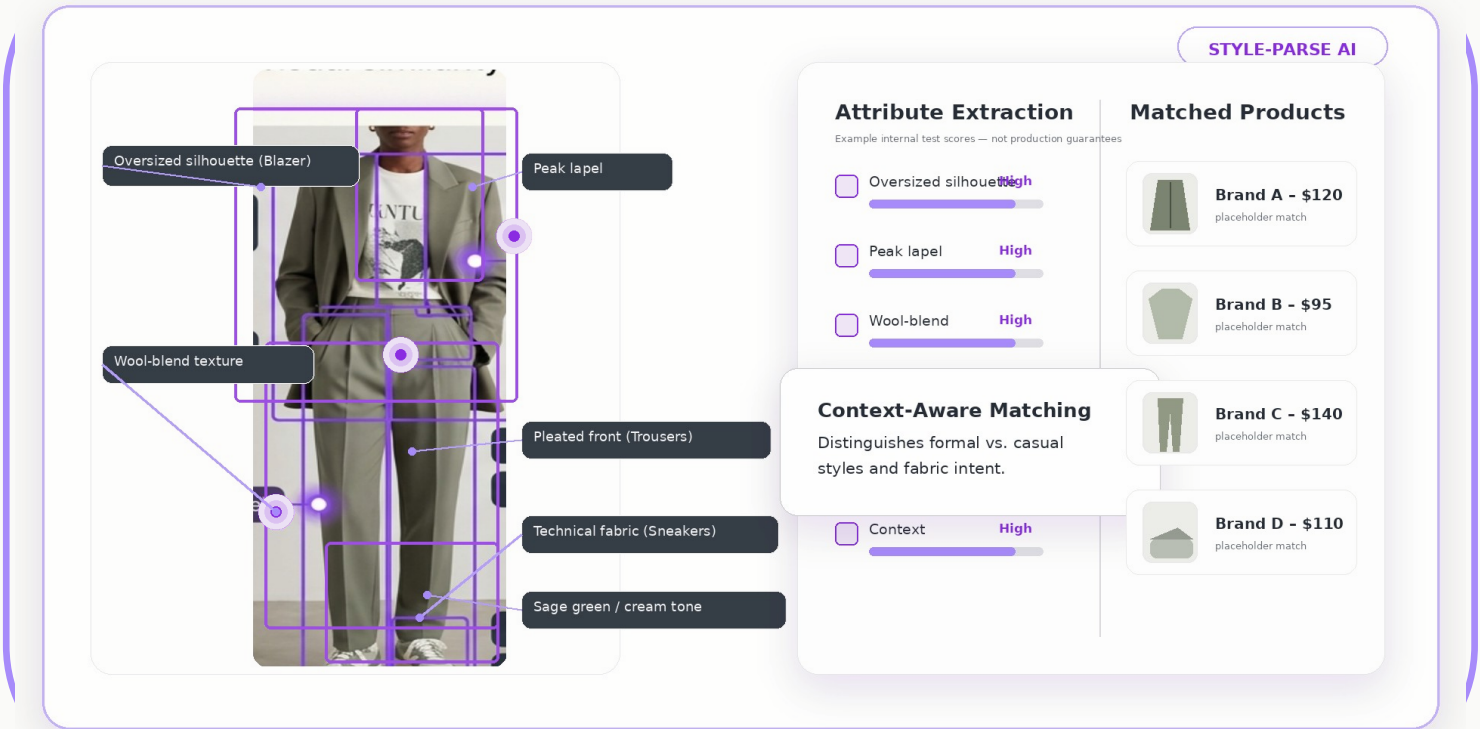

Context-aware matching designed to make a visual result feel purchasable.

Deep Attribute Extraction: Parses cut, silhouette, fabric, and fit—not just basic pixel similarity.

Contextual Intelligence: Understands the difference between “formal” and “casual” intent and fabric purpose.

Purchase-First Logic: Maps extracted data directly to live inventory across the retailer ecosystem.

Proven Signal: Early internal testing confirms repeatable attribute extraction across core fashion categories.

Generated mockup · example placeholders · internal test data, not production guarantees.

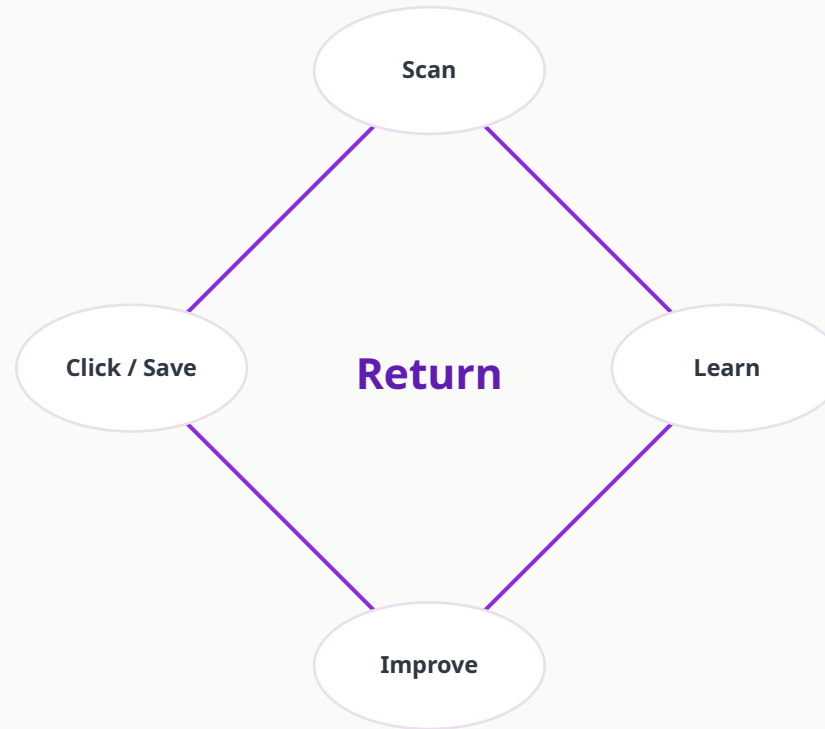

The Style DNA Vault

We are proving the loop that creates defensibility — not claiming the moat exists today.

IF THE PRODUCT WORKS

- Every scan builds a taste map
- Fit, brand, and budget preferences emerge
- Results improve over time
- Switching means starting over

Switching apps means losing your digital stylist.

\$500K · 18-month proof round

This round buys proof, not scale.

Allocation	Amount	Purpose	
AI Lead	\$140K	Style-Parse + matching	\$500K total round
Mobile Lead	\$120K	Camera-first MVP	
Infrastructure / APIs	\$60K	Vector DB, hosting, integrations	18 mo runway target
Creator Testing	\$50K	Early acquisition loop	
Product / UX Testing	\$40K	User testing and refinement	52% engineering-heavy
Legal / IP	\$10K	SAFE, basic IP, policies	
Operating Buffer	\$80K	Runway protection	
Outcome: working MVP + repeat usage signal + early conversion signal.

What this round proves

- 1 Users scan repeatedly
- 2 Users return
- 3 **D30 retention target >40%**
- 4 Scan-to-click behavior emerges
- 5 Creator loop begins
- 6 Seed-readiness evidence is created

**The keyboard is the last
friction point in
commerce.**

We are eliminating it.
